

As far as I could tell everything works fine. For the sample output for go back n, I only did 70 messages, which resulted in 32 messages combined being delivered. I know the project sheet says 20 delivered on each side but I could not get that all output to 1 file. I think around 115 messages there are 20 delivered packets/acks delivered on each side. I added it into my program that at the end it tells you how many received acknowledgements were received by the sender on either side.

To compile I used: gcc filename.c -o some name
